Public Health Assessment (Initial Release)

Evaluation of Exposures to Contaminants in Soil, Sediments, and Groundwater,
Bremerton Gasworks Superfund Site
Bremerton, Kitsap County, Washington

February 14, 2012

Prepared by

The Washington State Department of Health
Under Cooperative Agreement with the
Agency for Toxic Substances and Disease Registry

Foreword

The Washington State Department of Health (DOH) prepared this health consultation under a cooperative agreement with the Agency for Toxic Substances and Disease Registry (ATSDR). ATSDR is part of the U.S. Department of Health and Human Services responsible for health issues related to hazardous substances.

The purpose of a health consultation is to assess the health threat posed by hazardous substances in the environment. If needed, a public health assessment will recommend steps or actions to protect public health. Health consultations are initiated in response to health concerns raised by residents or agencies about exposure to hazardous substances.

This Public Health Assessment was prepared in accordance with ATSDR methodologies and guidelines. ATSDR reviewed this document and concurs with its findings based on the information presented. The findings are relevant to conditions at the site during the time this report was written. It should not be relied upon if site conditions or land use changes in the future. The glossary in Appendix A defines technical terms.

Use of trade names is for identification only and does not imply endorsement by DOH, the Centers for Disease Control and Prevention (CDC), ATSDR, the Public Health Service, or the U.S. Department of Health and Human Services.

For additional information, please contact us at 1-877-485-7316 or visit our web site at www.doh.wa.gov/consults.

For persons with disabilities this document is available on request in other formats. To submit a request, please call 1-800-525-0127 (voice) or 1-800-833-6388 (TTY/TDD).

For more information about ATSDR, contact the CDC Information Center at 1-800-CDC-INFO (1-800-232-4636) or visit the agency's web site at www.atsdr.cdc.gov.

Summary

Introduction

Past releases of polycyclic aromatic hydrocarbons (PAHs), petroleum hydrocarbons, and metals from the Bremerton Gasworks Superfund site in Kitsap County, Washington have occurred. These releases resulted in contamination of soil, groundwater, and sediment along the shoreline of the Washington Narrows. The Bremerton Gasworks Superfund site centers around a former manufactured gas plant (MGP) that operated from 1930 to 1963. Other past and current industrial activities adjacent to the former MGP may have also contributed to contamination. These activities include but are not limited to fuel storage and distribution; marine salvage and repair; boat part and pier float fabrication; electroplating; sheet metal duct work; concrete fabrication; possible landfill activity; etc.

The U.S. Environmental Protection Agency (EPA) is developing plans for a remedial investigation (RI) and feasibility study (FS) for cleanup. Through this process, EPA will determine the site boundary by investigating all sources and extent of contamination. For this public health assessment, the term 'site' refers to upland, shoreline, and waterway areas near the former MGP. This includes nearby locations of current and past industrial activities that may have contributed to contamination.

Overview

DOH

There are four general categories of public health hazards addressed in this document:

- Potential exposure from drinking water originating in the site
- Potential exposure from soil and sediment
- Potential exposure from contaminated groundwater
- Potential exposure from fish and wildlife grown on the site
- Physically hazardous terrain

DOH

Conclusion 1. Trespassing on the site could result in physical injury. This is an urgent public health hazard. Actions to remove or prevent these hazards have been recommended.

Basis for Decision. Several physical hazards are present at the site.

- The bluff at the end of Pennsylvania Avenue is very steep and has a well used path. This path leads to an area where a rope is necessary to go down to the shoreline. One of the owners, as well as Kitsap Public Health District, has cut this rope to discourage trespassers.
- At the bottom of the path, debris from former waste dumping is emerging from the bluff and shoreline sediment. Of concern is a rusted metal tank located adjacent to the path and hidden by brush. A person could very easily fall in or on the tank and become seriously injured.
- Two large former ballast tanks are abandoned on the shoreline. These tanks are heavy, anchored to the shoreline with an old rope, and do not move. It is not known what was in these tanks. Access at low tide could result in injury if a person tried to climb these tanks. They may even become trapped if entry is achieved.

Next Steps. To protect residents, visitors, and trespassers, DOH recommends that

- A sign be installed at the end of Pennsylvania Avenue prohibiting beach access.
- The rusted tank at the foot of the bluff be removed or fenced within three months.
- The submarine ballast tanks be removed by the owner in collaboration with EPA and Washington State Department of Natural Resources (DNR).

Conclusion 2. Residents, visitors, or trespassers touching or accidentally ingesting sediments for more than a year could harm the health of children or adults.

Basis for Decision. PAHs were found in sediments near seeps and a former pipe that led to the beach. Playing at the beach, touching, or accidentally ingesting these sediments could result in an increased risk for developing cancer. The risk estimates exceed EPA's range of acceptable estimated cancer risk.¹ For residents, we estimate 5 additional cases of cancer will develop for every 1,000 people exposed over a lifetime. Visitors and trespassers also exceed the acceptable range of cancer risk. Further information is needed to know how widespread the contamination is along the shoreline.

Next Steps. To protect residents and visitors, DOH recommends that

- Existing source(s) of contaminants be identified and removed or mitigated to reduce the potential
-
-
-
- EPA note the interest of the area on the shoreline. Its c
- Absorption may have been large. Monitoring should be ex
- Contamination is known and a remedial action plan should be developed.
- Kitsap Health District facilities, access, and management of the area are pre
- People are not able to contact most of the contaminated soils. However, a small portion of the
- Site should be remediated using other practices and with a

Conclusion 3. No harm

Basis for Decision. The City of Bremerton has never had public drinking water wells in the vicinity of the site. Thus, the people in residences and businesses in the area are not drinking groundwater contaminated by releases at the site.

Next Steps. No further action is necessary.

Conclusion 4. DOH cannot conclude if trespassers are touching contaminated soils at the site. The nature and extent of soil contamination are not known. Future land use may lead to contact with the soil. More soil sample data will be collected during EPA's upcoming RI.

Basis for Decision. Most of the former MGP footprint and industrial locations are now covered by asphalt. People are not able to contact most of the contaminated soils. However, a small portion of the former MGP is not covered. Trespassers may come into contact with contaminated soils in this area. More sampling and information on future land use is needed to fully assess if current or future health threats exist.

¹ EPA's acceptable increased risk of developing cancer ranges from developing one additional cancer case in 10,000 people exposed to one additional case for every 1,000,000 people exposed (1×10^{-4} to 1×10^{-6}).

Next Steps. DOH recommends that

- Site access be restricted and signed appropriately.
- Nature and extent of contamination in surface soils be characterized.
- Future land use be determined based on risks of disturbing remaining contaminants or recontamination of remediated areas.

Conclusion 5. DOH cannot conclude if people are being exposed to contaminants from eating fish or shellfish harvested at the site. Shellfish and fish tissue data are needed to assess any potential health threat.

Basis for Decision. Though uncommon, residents reported stories of people fishing off the bluff along the site. Commercial shellfish harvest in the area and recreational shellfish harvest on nearby public beaches have been closed for many years. DOH closed these areas because of combined sewer overflow releases and its use as an active harbor. The intertidal area near the site is not expected to reopen for shellfish harvest. However, the site is situated within the Suquamish Tribe's usual and accustomed (U&A) subsistence fish and shellfish harvest areas. Sediments are contaminated at the site (see conclusion #2) and the potential for contamination of fish and shellfish is likely. Fish and shellfish tissue data are needed to assess any potential health threat.

Next Steps. DOH recommends that a fish and shellfish tissue analysis be conducted to assess any potential health threat.

Conclusion 6. DOH cannot conclude if people are being exposed to contaminants from eating berries collected at the site. Soil samples near the berries have been analyzed and data are available to assess any potential health threat.

Basis for Decision. Many berries are grown at the site and are grown in the soil. The site is located at the end of Penn Avenue. Some residents have been growing berries at the site. No soil samples have been analyzed near the berries.

Next

- People refrain from eating fruit grown at the site until more is known about the contaminants in the soil and berries.
- More sampling of soil where berries grow and berries be analyzed for contaminants of concern.

For More Information

A copy of this public health assessment report will be provided to EPA, Washington State Departments of Ecology and Natural Resources (DNR), current and past owners, current tenants, City of Bremerton, the Suquamish tribe, and Kitsap Public Health District and the Kitsap Regional Library in downtown Bremerton.

A copy of this public health assessment report will be placed on the DOH web site assessment webpage: <http://www.doh.wa.gov/consults>. If you have any questions about this health consultation contact Rhonda Kaetzel at 360-236-3357 or 1-877-485-7316 at Washington State Department of Health.

For more information about ATSDR, contact the Center for Disease Control and Prevention (CDC) Information Center at 1-800-CDC-INFO (1-800-232-4636) or visit the agency's web site at www.atsdr.cdc.gov.

DRAFT

Purpose and Statement of Issues

The purpose of this public health assessment is to 1) determine whether chemical releases from of the Bremerton Gasworks Superfund site pose a public health threat, 2) recommend appropriate actions to protect public health, and 3) identify data gaps where additional sampling may be needed to better assess health risks. The Bremerton Gasworks Superfund site centers around a former manufactured gas plant (MGP) that operated from 1930 to 1963. Other past and current industrial activities adjacent to the former MGP may have also contributed to contamination.

The Washington State Department of Health (DOH) prepared this public health assessment under a cooperative agreement with the Agency for Toxic Substances and Disease Registry (ATSDR). This health assessment is mandated by the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980. On September 15, 2011, the U.S. Environmental Protection Agency (EPA) proposed to place the Bremerton Gasworks site in Bremerton, Washington on the National Priorities List (NPL) in accordance with Section 105 of CERCLA 42 U.S.C. 9605. The NPL is EPA's list of the nation's most contaminated hazardous waste sites, also known as Superfund sites. ATSDR is required to conduct a health assessment for all sites proposed for inclusion on the NPL. On May 10, 2012,

This health assessment is a preliminary report. It is not intended to be a final report. The health assessment will be written in a report that will provide information for the public and the agencies involved in the remediation process. The report will include information about the site, the health risks, and the remediation process. The report will be available to the public at the following location: [http://www.wa.gov/DOH/Programs/EnvironmentalHealth/Remediation/HealthAssessment/BremertonGasworks/](#)

Background

Site

The site is approximately one mile north by northwest of downtown Bremerton and the ferry dock (Figure 1). It lies along the south shoreline of the Port Washington Narrows less than a half mile west of the Warren Avenue Bridge. The site has a gentle north-facing slope with bluffs approximately 40–50 feet above sea level. The Port Washington Narrows connect Dyes Inlet to Sinclair Inlet. Sinclair Inlet drains into the Puget Sound.

The formal boundaries of the site have yet to be determined by EPA. Data collected during the remedial investigation (RI) and cleanup feasibility study (FS) will help determine all the sources, nature, and extent of contamination. In addition to the operations at the former MGP, other past and current industrial activities may have contributed to the contamination at the site. **For this assessment, the term ‘site’ refers to the upland, shoreline, and waterway areas near the former MGP footprint. It also includes nearby locations of current and past industrial activities.**

Figure 1. Bremerton Gasworks Superfund area including site-related parcels (A–F), former manufactured gas plant boundary, and state aquatic lands in Bremerton, Kitsap County, Washington.

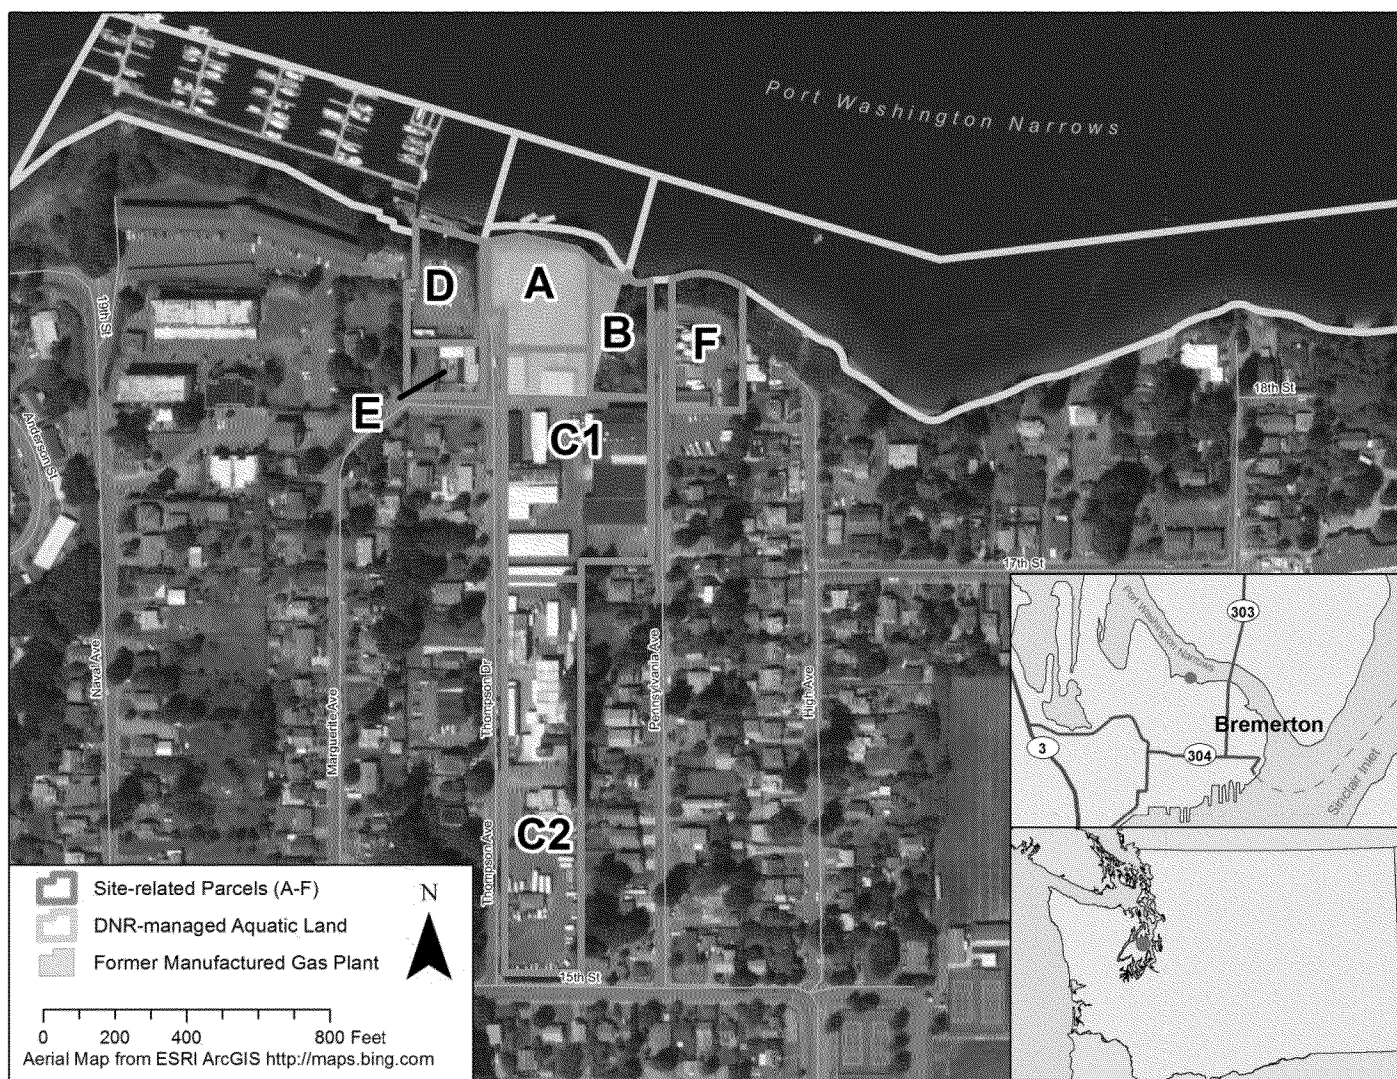

Table 1 provides a list of parcels with known past or current business operations that may have contributed to contamination.

Table 1. Parcel identification and industrial activities in the area of the Bremerton Gasworks Superfund site, Bremerton, Kitsap County, Washington.

Parcel	Parcel Number	Current Owner	Current Activity	Past Activity
A	3711-000-001-0409 address not available	McConkey	Storage (vehicles and implements)	Gas production, former product dock, metal fabrication (cutting fitting, welding, electroplating, sandblasting, and painting)
B	3741-000-022-0101 address not available	Sesko	Vacant	Gas production, bulk fuel distribution, former product dock, industrial and/or municipal landfill, metal salvage and repair of ship parts
C	C1 3711-000-001-0607 1723 Pennsylvania Ave.	Penn Plaza Storage LLC (McConkey)	Storage; light industrial activity (e.g., welding)	Gas production, storage, industrial activities (sheet metal shaping, pipe fitting, plumbing storage and supply, pier manufacturing, welding, building and repair of boat parts, electrical contracting, manufacture of granite countertops, etc)
	C2 142401-2-025-2008 1512 and 1550 Thompson Dr.	Penn Plaza Storage LLC (McConkey)	Storage; light industrial activity (e.g., welding)	Fabrication of concrete blocks, sewer pipes, and manholes; concrete storage; concrete covering of pier floats
D	3711-000-010-0002 1805 Thompson Dr. Bldg B	Seven JS Investments LLP	Marina parking lot and upland boat storage	Marina parking lot and upland boat storage; former product pipeline; former product dock
E	3711-000-009-0005 1701 Thompson Dr.	Pipeworks Mechanical & Service, Inc.	Vacant	Bulk fuel distribution, furniture fabrication, marine propeller electrical repair part supplier
F	3741-000-001-0007 1702 Pennsylvania Ave.	Pacific Northwest Energy Company Corporation (SC Fuels)	Bulk fuel distribution (diesel)	Bulk fuel distribution, former product pipeline and dock

Note: Site boundary has not yet been determined by the U.S. Environmental Protection Agency; operation information from site documents (Anchor 2011 (1), Ecology and Environment 2009 (2), Hart Crowser 2007(3) and current owners; parcel information from Kitsap County Assessor (<http://kcwppub3.co.kitsap.wa.us/ParcelSearch/>)).

Residential areas border these parcels on the east, west, and south. Thompson Drive and Pennsylvania Avenue are owned and operated by the City of Bremerton. A combined storm sewer overflow outfall runs from Pennsylvania Avenue and discharges approximately 30 yards offshore of the site. The site is located within the Suquamish Tribe's usual and accustomed fishing and shell fishing area (U&A). Within the U&A, the tribe has treaty-reserved fishing and shell fishing rights. The tribe co-manages fishery resources with the State of Washington.

The intertidal and subtidal lands in this area are state-owned aquatic land managed by the Washington State Department of Natural Resources (DNR). This includes the land along the shoreline that is exposed and submerged with the ebb and flow of tides. The shoreline is mostly accessible when water is at 4 feet above mean lower low water ² (+4) and below.

The following bullets describe known current uses on the parcels listed in Table 1 and shown in Figure 1. A brief description of parcel conditions that limit or impact human exposure to site contaminants is also provided. Access to parcels A, B, and C1 are within a fence with locked entrance.

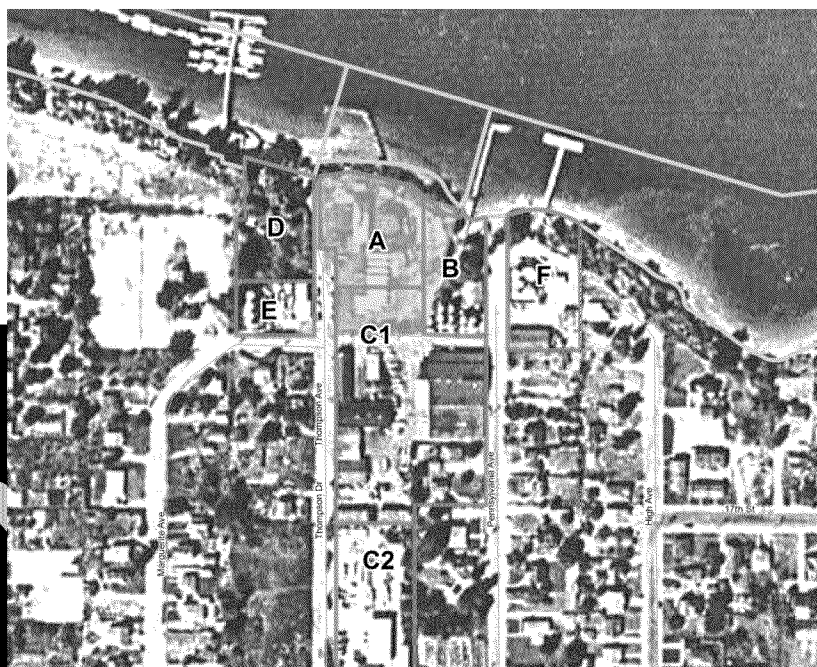

- # DRAFT

Bremerton Gasworks (Former MGP): The former MGP operations are a source of primary concern at the site. The former MGP covered **parcel A, the west of parcel B, and north of parcel C1** (Figures 1–3). Under several different owners, this plant provided manufactured gas to City of Bremerton customers for lighting, heating, and cooking. The MGP structures were originally constructed to extract gas from coal using the carbureted water gas process (3). This process injected steam through an incandescent bed of coke or coal. The water gas produced was then fed into a carburetor where it was enriched with light hydrocarbons. It is unknown what fuel was used to enrich the water gas. However, petroleum oil-based feed stocks commonly used included naphtha; gas oils (diesel, heating, and fuel oils); and residual oils.

² Mean lower low water (MLLW) is the average height of the lower low waters over a 19-year period. Lower low water is the lower of the two low water tides of the day.

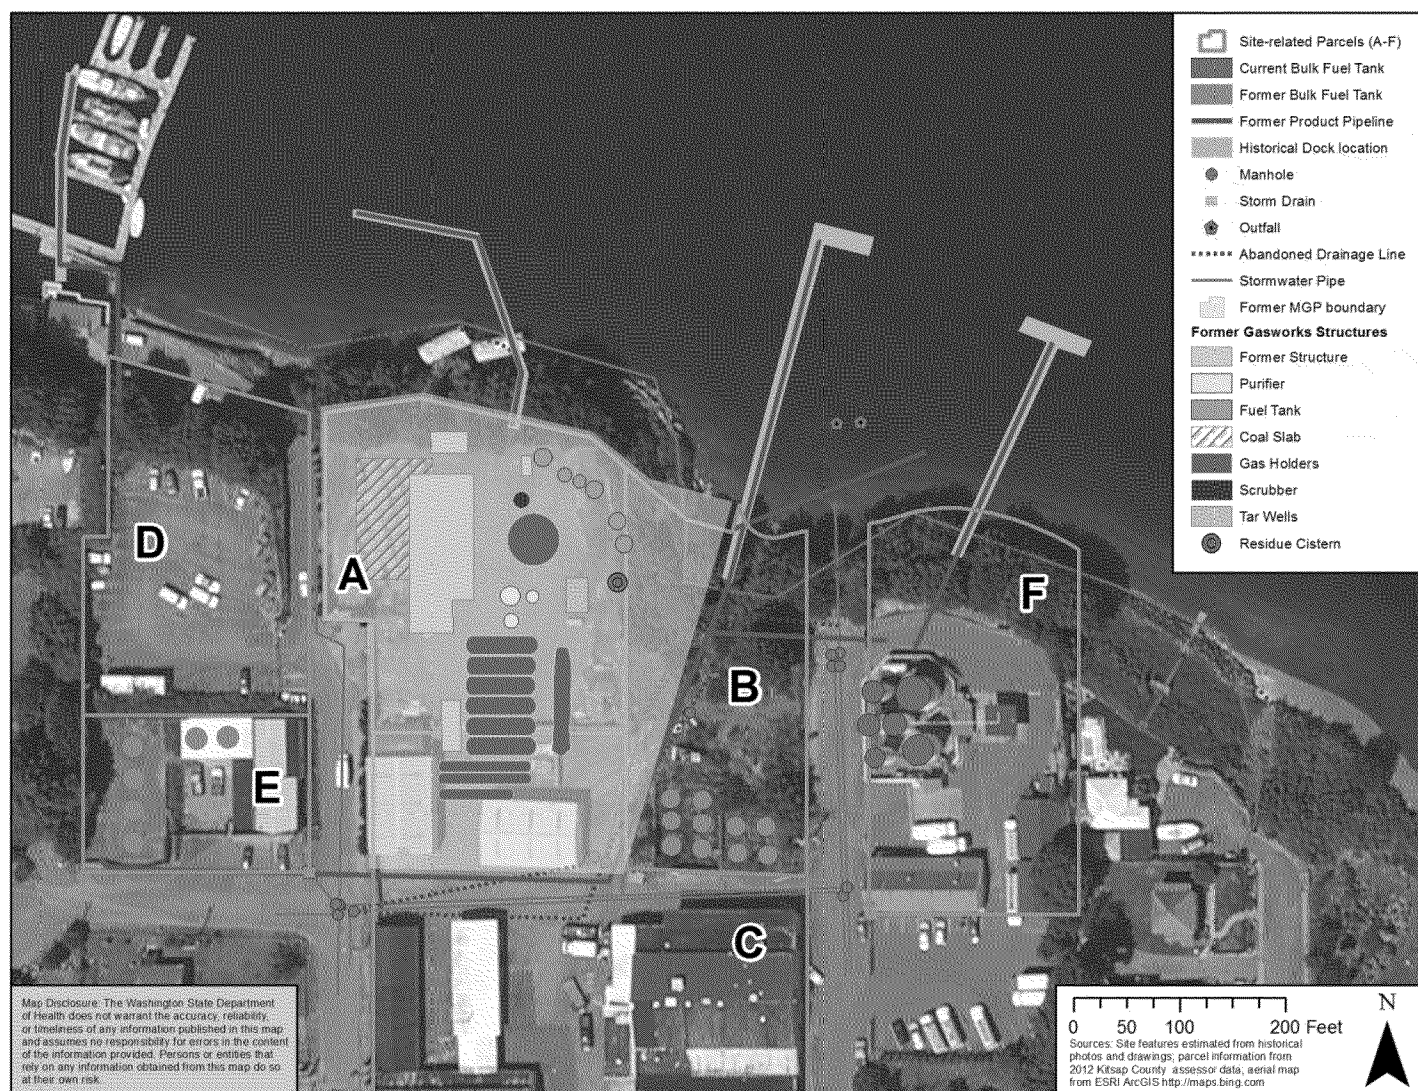

Figure 2 demonstrates actual structure configuration and boundaries of the former gasworks plant on a historical photo from the 1950s. Figure 3 provides a more detailed, close-up view of the former structures. These structures included a coal storage area; water gas generator; winch; gas holder and gas tanks; diesel, oil, and gasoline tanks; purifiers and scrubbers; tar well; residue cistern; and numerous underground pipes. Figure 2 shows three piers servicing the area.

Figure 2. Historical aerial photo of the Bremerton Gasworks Superfund site area in Bremerton, Kitsap County, Washington

The MGP used a carbide-water process from 1950 to 1963 to produce calcium carbide for the Cascadia Portland Cement plant. The process involved the use of coke and water to produce liquid and gas. The site was contaminated with various chemicals and heavy metals. Dismantling of facility structures commenced by 1971 (3).

Figure 3. Former structures of the manufactured gas plant and bulk fueling facilities near the site, Bremerton, Kitsap County, Washington.

- ## Environmental Investigations

In 1992, Ecology inspected Lee Fabricators, a former metal fabrication business in operation since 1986 on parcel # [REDACTED]. The building was used for manufacturing of various types of Dyes Inlet [REDACTED]

In 1995, DNR observed unpermitted building of ship parts and reclamation activities on **parcels A and B**. DNR requested that Ecology perform a Site Hazard Assessment {Ecology, 1995 5 /id}. Unrelated to these activities, a black gooey substance with a creosote odor was identified on the bluff of **parcel B**. PAHs and metals were determined to be contaminants of concern based on one sediment and three soil samples. Ecology added the site to the state's Hazardous Site List.

In 1998, Ecology performed an initial investigation at **parcel F**, the current bulk fuel facility located on Pennsylvania Avenue (6). Groundwater and soil samples confirmed the presence of non-halogenated solvents and petroleum products above cleanup levels. Pacific Northwest Energy Company entered Ecology's Voluntary Cleanup Program (FS ID 2788449) in 2001. They exited the program in 2009. DOH did not have any site documents at the time of this review. Three leaded and unleaded 10,000-gallon USTs and a 5,000-gallon waste oil UST were removed from the facility in the early 2000 (3;6).

In 2010, Kitsap Public Health District investigated reports of an oily sheen on the shoreline of parcels A and B. The release was from an old pipe filled with what appeared to be leftover coal tar product and contaminated sediment. The Coast Guard located the pipe two feet under the surface then cut and plugged the end. They excavated approximately 4,000 square feet of contaminated sediment. The Coast Guard and EPA's Superfund Technical Assessment and Emergency Response Team (START) collected and analyzed 30 sediment samples. They identified high PAH contamination covering about 100 square feet extending out 60 feet below the high tide line. (1). The depth of contamination was not determined. EPA entered into an Agreed Order with a former owner, Cascade Natural Gas Corporation, to stop the release. The release came from what appeared to be an abandoned sewer storm water outfall pipe. It was once connected to, or may still be connected to, an abandoned vault. The vault likely received discharge from metal mining on the former MGR facility, parcels A and B. (1). Cascade Natural Gas removed approximately 100 cubic yards of sediment from the vault. The vault is approximately five feet across and three feet deep. The vault is made of concrete and has no access points. The vault is located on the NPL site. The vault is located near the shore of parcel A. The vault is located near the shore of parcel B. The vault is located near the shore of parcel C. The vault is located near the shore of parcel D. The vault is located near the shore of parcel E. The vault is located near the shore of parcel F. The vault is located near the shore of parcel G. The vault is located near the shore of parcel H. The vault is located near the shore of parcel I. The vault is located near the shore of parcel J. The vault is located near the shore of parcel K. The vault is located near the shore of parcel L. The vault is located near the shore of parcel M. The vault is located near the shore of parcel N. The vault is located near the shore of parcel O. The vault is located near the shore of parcel P. The vault is located near the shore of parcel Q. The vault is located near the shore of parcel R. The vault is located near the shore of parcel S. The vault is located near the shore of parcel T. The vault is located near the shore of parcel U. The vault is located near the shore of parcel V. The vault is located near the shore of parcel W. The vault is located near the shore of parcel X. The vault is located near the shore of parcel Y. The vault is located near the shore of parcel Z.

Climate In the Pacific Southwest, low temperatures are characteristic of the mild, rainy winter and dry summer. Temperatures do not vary dramatically between winter and summer months, with temperatures ranging from 40 to 60°F (4 to 15°C) in the winter and 60 to 80°F (15 to 27°C) in the summer (National Oceanic and Atmospheric Administration 2002).

with

Groundwater. Sand and gravel deposited during the last ice age compose the aquifers in the area. Based on topography and local drainage patterns, shallow-seated groundwater flows to the north or northeast (5). From previous reports, depth to groundwater is estimated at 10 to 20 feet deep.

DOH

- Chinook salmon – no more than 1 meal per week (all of Puget Sound).
- Resident juvenile Chinook salmon (blackmouth salmon) – no more than one meal per month (all of Puget Sound).
- Puget Sound rockfish – no more than one meal per week from Bremerton area and most of Puget Sound. Do not eat Puget Sound rockfish from Sinclair Inlet.
- Yelloweye and canary rockfish – Do not eat.
- English sole and other flatfish – no more than one meal per week from Port Orchard Passage and no more than one meal per month from Sinclair Inlet.

³ Access to the shoreline occurs when the water is less than four feet above mean lower low water (4+ tide). Mean lower low water is the average of the lowest low tides recorded at a tide station. The closest NOAA tide station is at Tracyton, Dyes Inlet. Estimates are days in 2011 with 4+ tides or lower that occur between 7 a.m. and 7 p.m.

DNR-00024411

Bivalves (Clams, Oysters, and Mussels). Shellfish bivalve species known to the area include oysters, mussels, and a variety of clams. DOH and Kitsap Public Health District regularly test shellfish and water for fecal and biological toxins. DOH has closed commercial harvest in the area and recreational harvest on nearby public beaches for many years because of combined sewer overflow outfalls. **Do not eat shellfish from the Bremerton Area.** Several starfish, small crabs, clam shells, and other invertebrates were observed at low tide during the site visit in July 2012.

Crab and Shrimp. Dungeness crab (*Cancer magister*) live in the subtidal sediments of the Port Washington Narrows. Spot (*Pandalus playceros*), coonstripe (*P. danae* and *P. hypsinotus*) and pink shrimp (*P. eous* and *P. jordani*) are known to Puget Sound and probably present in the Narrows. DOH has a crab advisory for the Bremerton area. Advisories assume that an adult meal size equals 8 ounces (227 grams) of uncooked crab. **Do not eat Dungeness and red rock crab from the Bremerton area.**

Demographics

The site is located in an urban area of Bremerton. Nearby, there are industries, residences, businesses, schools, and the Port of Washington Marina. Bremerton is the largest city on the Kitsap peninsula. It's the home to the Puget Sound Naval Shipyard and U.S. Navy base.

Dis

Exposure Evaluation

The exposure evaluation consists of three components

1. understanding the nature and extent of environmental contamination at and around the site;
2. identifying exposure pathways by evaluating who may be or has been exposed to site contaminants; and
3. identifying uncertainties and data gaps to be filled that would help understand exposures to people.

Nature and Extent of Contamination

DOH used environmental data collected during several investigations to evaluate the nature and extent of contamination at the site. Figure 4 demonstrates the sample locations of data available from the site. See the section on Environmental Investigations section (page 16) for details of these investigations. Tables 2, 3, and 4 summarize detected compounds in sediment, surface soil, and groundwater respectively.

Sediments. Sediment samples from the shoreline have been taken during four investigations.

- In March 1995, one sediment sample (depth unknown) was analyzed for metals, and SVOCs during an investigation by Ecology (5;7). These data were not used in the current evaluation. They do not represent current conditions but do identify locations of high contamination not well characterized recently.
- In June 2008, five sediment samples (depth unknown) were analyzed for metals, SVOCs, and TPH-Dx (2) during the EPA Brownfield assessment.
- In October 2010, 31 sediment samples (30 cm deep) were analyzed for metals, SVOCs, VOCs, and TPH during the emergency action removal of the leaking pipe (8). Of these, nine were covered by the interim action placement of a clay mat and rocks.
- In November 2010, samples of removed materials including three sediment samples (30 cm deep) and two samples of sediment/product in the pipe were analyzed for metals, SVOCs, VOCs, and TPH. These data were not used in the current evaluation but identify contaminants of concern.

In general, PAHs are elevated on the shoreline and the extent and depth are not well characterized. Several compounds were analyzed with high detection limits. Limited data suggest that metals are not of concern, but more information is needed. Table 2 summarizes detected compounds in sediment used in this evaluation.

Soils.
comp

- In May 2008, EPA's Brownfield assessment, sediment samples were taken up to 45 feet deep at the surface location (2). The samples were analyzed for metals, SVOCs, and TPH-Dx (2).
- In November 2010, during the interim action removal of the leaking pipe, sediment samples (30 cm deep) were analyzed for metals, SVOCs, VOCs, and TPH. These data were not used in the current evaluation but identify contaminants of concern.

PAHs and TPH concentrations in sediment are not well characterized. In the Exposure Pathway section (page 29), the only people that would be exposed to chemicals in subsurface soils would be occupational exposures during excavation work. These workers are protected under the Occupational and Safety Health Administration (OSHA). Therefore, these exposures are not evaluated here.

Groundwater. During the Brownfield assessment in June 2008, six groundwater samples were analyzed for metals, SVOC, VOC, and TPH-Dx (2;9;10). Table 4 summarizes detected compounds in groundwater. As noted below in the Exposure Pathway section, people are not drinking this contaminated groundwater. However, this water can be discharging into the narrows.

Figure 5. Sample locations from previous investigations at the Bremerton Gasworks Superfund site, Bremerton, Kitsap, Washington

Notes:

^a Bold

^b Table includes detected chemicals and chemicals with detection limits above the CV. Compounds not detected not listed.

^c ATSDR CVs based on child soil exposures were used for screening (CVs for sediment exposures have not been developed). To be conservative, soil CVs reflect residential exposures and are expected to overestimate sediment exposures on the shoreline.

^d Surrogate compounds were selected for chemicals that have no CV. Selection is based on structural and physiochemical properties. Surrogates and values designated with brackets [].

^e PAHs associated with carcinogenic effects (cPAHs) have a ~ preceding their name. For each sample, each PAH is multiplied by potency factor relative (RPF) to BaP as presented by EPA 2010 (11). These are summed and presented as the Total cPAH BaP Equivalent (BaP-EQ).

^f Per ATSDR, CV is health-based for non-carcinogenic effects only, not carcinogenic effects. CREG CV is below background.

Table 2 Abbreviations:

Exposure Pathways

In order for a chemical to harm human health, people must come into contact with the chemical. An exposure pathway describes how a chemical moves from a source and comes into contact with people. An exposure pathway is specific to when it occurred or will occur: the past, present, or future. An exposure pathway has five elements:

1. a source of contaminants;
2. a release mechanisms into water, soil, air, or the food chain
3. an exposure point or area
4. an exposure route (ingestion, dermal contact, or inhalation); and
5. a potentially exposed population.

Exposure pathways may be “completed”, “potential” or “eliminated”. A completed pathway has all five elements in place and occurring. A potential pathway has one or more of the elements unknown. If one of the five elements is not in place and occurring, the pathway is eliminated and not evaluated. Table 5 describes the completed, potential, and eliminated exposure pathways for the Bremerton Gasworks Superfund site.

DOH identified the following **completed pathways** at the site:

- Currently and in the past, residents, owners, and workers come in contact with contaminated sediment on the shoreline.
- Currently and in the past, inhalation of vapors from creosote-treated pilings on parcel A is occurring. Workers, site trespassers, and residents may potentially be exposed to chemicals being

- DOH identified the following **potential pathways** at the site:
 - Occurrence and future potential for contamination of residents are seeps have been observed. No exposures have been reported. There is uncertainty to the contamination is limited to the contaminated areas. These exposures are associated with surface soils, surface water, sediment, and the contaminated. Reported forcible trespassers have been at the site.
 -
 -
 -
- Avenue adjacent to parcel B. This location has not been tested for contaminants in soils. Some contaminants are known to accumulate in berries.
- Future use of the property may increase access to the shoreline. This would increase daily exposures of children and local residents to contaminants in surface soils and shoreline sediments.
- In the future, shellfish harvest could occur at low tide by residents, recreational visitors, and tribal subsistence harvesters. Eventually combined sewer overflows will be contained reducing fecal contamination in shellfish. Though unlikely, public beaches in the Narrows may be opened for shellfish harvest.
- Current and future use of the Narrows for fishing is unknown. Potential areas of sediment contamination may exist near former dock structures and seeps. Fish living nearby may be contaminated. Eating these fish could result in increased exposures of contaminants which accumulate in fish.

Some exposures are not occurring at the site or are extremely unlikely. DOH eliminated the following exposure pathways.

- Currently, in the past, and in the future, contaminated groundwater at the site is not used as a drinking water source. Bremerton does not have source wells in the area. No private wells in the area exist. No springs on site have been identified. No exposure is expected.
- In the past and currently people may not harvest shellfish near the site. For many years, area commercial harvest and recreational harvest on nearby public beaches have been closed by DOH. No exposure is expected.

DRAFT

Table 5. Exposure Pathways for the Bremerton Gasworks Superfund site, Bremerton, Kitsap County, Washington

Pathway Name	Exposure Pathway Elements					Time Frame
	Source	Media	Point of Exposure	Route of Exposure	Potentially Exposed Population	
Surface Soil	Past disposal of MGP waste; Leakage from storage tanks; Landfill debris from municipal and gasworks activities; Runoff from industrial activities.	Soil	Surface soil and on slope to shoreline	Ingestion; Dermal Contact	Trespassers; Site workers	Past
					Local residents; Trespassers; Recreational visitors	Present; Future
Subsurface soil	Past disposal of MGP waste; Leakage from storage tanks; Landfill debris from municipal and gasworks activities; Abandoned product pipes	Subsurface Soil	Subsurface soils	Ingestion; Dermal Contact	Site workers	Past; Present; Future
Surface Water	Contaminated soils released into storm water runoff; waste product released into the Narrows	Surface Water	Storm water runoff	Ingestion; Dermal Contact	Trespassers	Past; Present; Future
					Local residents; Trespassers;	Future
Air	Release of volatiles from waste in surface soil and surface water runoff; Creosote-treated pilings on shoreline	Air	Air near or on property	Inhalation	Local residents; Trespassers; Recreational visitors; Tribal harvesters	Past; Present; Future
Public Water Supply	Past deposit of MGP waste in wells, soils; Leakage from storage tanks	Municipal Water Supply	Tap water	Ingestion	Past users of municipal water Supply	Past
			None	None	None (different water source)	Present; Future
Private Water Supply	Past deposit of MGP waste in wells or soils; Leakage from storage tanks	Groundwater (Private Wells)	Well water	Ingestion	Past local residents with private wells	Past
			None	None	None	Present; Future
Sediment	Seeps from contaminated groundwater; Release of product from abandoned pipes; Creosote-treated pilings; Surface runoff from facility; Fuel and oil spills from boats formerly docked in the area	Sediment	Sediments on shoreline	Ingestion; Dermal Contact	Trespassers	Past; Present; Future
					Local residents; Trespassers; Recreational visitors; Tribal harvesters	Future
Food Chain (Biota)	Past deposit of MGP waste in soils, water, or the narrows; Landfill debris from municipal and gasworks activities; Contaminated storm runoff from facility	Food	Blackberries	Ingestion	Local residents; Trespassers; Recreational visitors (exposure limited to late summer and fall)	Past; Present; Future
Food Chain	Seeps from contaminated groundwater; Release of	Food	None	None	None	Past

			Fish	Ingestion	Local residents; Trespassers; Recreational visitors; Tribal harvesters	Fut

DRAFT

Data Gaps

Additional data is necessary for a more definitive assessment of human exposures and possible health effects. Sampling should be focused on locations where people live, spend time, and play.

Sediment. The intertidal shoreline will be used in the future by residents, tribal members, or recreational visitors. The extent of contamination is not known. The surface sediment is well characterized near the mat and rocks placed in 2010 during the emergency action. A limited number of samples beyond this area have been taken. Sediment samples have only been taken between Thompson and Pennsylvania Avenues. The depth of contamination is not known. Nothing is known about the sediments further than approximately 120 feet offshore below the low-water mark. It is possible that effluent from the former MGP was released directly into the Narrows. Most effluent would have been carried away with the tide. Heavier residues from the gasification process may have drifted down into the sediments of the narrows. Contaminants in these sediments may impact shellfish and fish that may be harvested and eaten.

The nature of contamination has only been partially identified. Of the sediment samples taken, VOCs and SVOCs have been well characterized, though some had high detection limits. The PAH data for sediment samples 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 8

DRAFT

Subsurface monitoring has been conducted at the site since 1990. The monitoring has identified MGP product residues. Residues were detected up to 55 feet below the surface. The extent of contamination is not well characterized.

Groundwater. People are not drinking the contaminated groundwater at the site (see exposure pathways section). Thus direct exposure to groundwater does not occur and more groundwater information will not help understand human exposures. Little information could be found regarding the relationship between the groundwater beneath the site and seeps or springs along the shoreline. Multiple anecdotal stories of seeps have been reported, some of which have been “oily.” It is not clear where, or if, the contaminated groundwater is being released along the shoreline, thus the sources of contamination have not been identified.

Air. People walking on the shoreline or working at the site would be exposed to chemicals in the air. No air sampling has been conducted at the site. Creosote-like smells were observed along the shoreline. Sources for these smells should be identified and depending on the source, air sampling and analysis should be considered. Extensive wind movement along the Narrows will dilute chemicals in the air. It is unlikely that air would stagnate or remain in one location. However, exposure to chemicals in the air cannot be estimated at this time.

Biota. The Suquamish tribe has U&A rights to harvest shellfish and fish in the Washington Narrows. During the site visit, clam shells and crab carcasses were observed on the beach during low tide. No information on the ecological sustainability of these and other species as a resource is available. No shellfish or fish chemical data in tissue is available. More information is needed to better understand exposures through consumption of fish and shellfish.

Nearby residents eat blackberries grown at the shoreline, particularly at the end of Pennsylvania Avenue. Concerns have been raised about potential contamination of berries. Berries have been shown to accumulate PAHs and some metals {2002 9 /id} which have been reported at the site. Neither soil samples nor berry samples have been sampled and analyzed, therefore exposures cannot be evaluated.

Other Contaminants. Other contaminants that were not analyzed for may be present at the site. Dioxin and furan compounds are oftentimes by-products from the combustion of fuel oils and gasification residues therefore sediments and soils should be analyzed for these contaminants-dioxins are considered carcinogenic at any detectable level. Because of the boat repair and part fabrication that occurred at the site, tributyltin should be analyzed for. Tributyltin was frequently used in marine paints.

Nearby Sources and Locations Data from sampling done to determine the nature and extent of contamination at the site and in the surrounding area are shown in Figure 2. The sampling was done in the form of a grid around the site, with the grid extending to 100 m from the site. The grid was divided into 10 m by 10 m squares. The sampling was done at the center of each square. The sampling was done at two locations: one at the site and one at a location 100 m from the site (see Figure 2). More data are needed to understand the extent of contamination at the site.

Health Evaluation

Screening

The goal of this screening analysis is to identify whether the concentrations of environmental data are compared with the background comparison values. Concentrations of soil, sediment, and water (e.g., groundwater) are compared with background concentrations of soil, sediment, and water (e.g., groundwater) to determine if the concentrations are significantly higher than the background concentrations.

CVs are conservative and non-site specific and set to protect the most sensitive population, usually children. CVs are based on health guidelines with uncertainty or safety factors applied to ensure that they protect public health. **Chemicals detected below their CV** are not expected to result in health effects upon contact. These chemicals are not considered further in the public health assessment process.

Chemicals detected above their CV, do not necessarily represent a health threat. These chemicals are identified for a detailed, site-specific evaluation to determine if health effects are expected to occur. CVs are not intended to be used as environmental clean-up levels.

CVs can be based on either carcinogenic or non-carcinogenic effects. Cancer CVs are calculated from EPA's oral cancer slope factor (CSF). CVs based on cancerous effects account for a lifetime exposure (70 years). They are based on an estimated excess lifetime cancer risk of one extra case per one million people exposed. Non-cancer CVs are calculated from ATSDR's Minimal Risk Levels (MRLs) or EPA's Reference Doses (RfDs). Some chemicals have both a cancer CV and non-cancer CV. When this happens, the lower of these values is used to be protective. Chemicals without a CV use a surrogate CV of a chemical that has similar structural and physiochemical features. CVs include Environmental Media Evaluation Guidelines (EMEGs), Cancer Risk Evaluation Guidelines (CREGs), and Reference Dose

Media Evaluation Guidelines (RMEGs), MTCA state cleanup levels, and EPA Regional Screening Levels (see definitions in the glossary in Appendix A).

Exposures to sediments are the only pathways evaluated with adequate data for initial screening. As a conservative approach, the screening analysis will compare sediment concentrations with soil CVs. Table 2 summarizes chemicals in sediment that exceed soil CVs. PAHs associated with carcinogenic effects (cPAHs) are of concern and will be evaluated further for resident, trespasser, and visitor exposures. Neither soil nor water exposures are evaluated further at this time. Soil data are not adequate to complete a full evaluation; more data are needed. Groundwater exposures are not occurring so they are not evaluated further. Though not evaluated further, Tables 3 and 4 summarize chemicals that exceed soil and water CVs respectively.

The PAH chemical class includes organic compounds. Most PAHs are fat-loving compounds, generated from the incomplete combustion of organic matter, including oil, wood, and coal. They are found in materials such as creosote, coal, coal tar, and used motor oil. Thus, their presence at the site near the former MGP in Bremerton is not surprising. Dietary sources make up a large percentage of PAH exposure in the U.S. population (8). Grains and smoked or barbequed meat and fish contain relatively high levels of PAHs. The majority of dietary exposure to PAHs for the average person comes from ingesting [REDACTED] group [REDACTED]

Non-*carcinogenic*

DISCUSSION

Carcinogenesis

Approximately 41% of respondents reported that they had not been involved in the development of the clinical guidelines.

multiplied by the chemical's cancer potency factor. Cancer potency factors, also known as a cancer slope factors, are chemical specific. Some cancer potency factors are derived from human population data and others are derived from laboratory animal studies. Sometimes the doses in animal studies are much higher than encountered in the environment. Use of animal data requires extrapolation of the cancer potency from high dose studies down to low-level exposures. This process involves much uncertainty.

With some exceptions, current regulatory practice assumes there is “no safe dose” of a carcinogen. In other words, any dose of a carcinogen will result in some additional cancer risk. The validity of “no safe dose” assumption for all cancer-causing chemicals is not clear. Some chemicals must exceed a certain dose threshold before initiating cancer. For such chemicals, cancer risk estimates are not appropriate. Unless a chemical has been shown to have a threshold, DOH assumes that no threshold exists.

⁵ According to the National Cancer Institute (NCI) based on 2007–2009 incidence rates.

DOH describes cancer risks estimated for site-related contaminants in qualitative terms. Terms used to describe the increased risk of developing cancer include moderate, low, very low, slight, and insignificant. To better understand these terms, consider how big the population size at the site must be to see additional cases of cancer. For example, a low cancer risk would be associated with one additional case in 10,000 people exposed over a lifetime (1×10^{-4}). A very low estimate reflects one additional cancer case in 100,000 people exposed over a lifetime (1×10^{-5}). DOH and EPA generally consider a cancer risk up to one additional case of cancer in 10,000 people to be an acceptable risk. Ecology considers cancer risk up to one additional case of cancer in 100,000 people to be acceptable risk.

<u>Estimated Cancer Risk</u>		
Cancer risk estimates do not reach zero no matter how low the level of exposure to a carcinogen. Terms used to describe this risk are defined below as the number of excess cancers expected in a lifetime:		
<u>Term</u>		<u>Number of Excess Cancers</u>
Moderate	approximately equal to	1 in 1,000
Low	approximately equal to	1 in 10,000
Very Low	approximately equal to	1 in 100,000
Slight	approximately equal to	1 in 1,000,000
Insignificant	less than	1 in 1,000,000

Because cPAHs in sediment exceed the soil cleanup levels, a more in-depth analysis is warranted.

Because cPAHs in sediment exceed the soil cleanup levels, a more in-depth analysis is warranted. The risk estimates are based on the use of the equation described in Appendix C. Potential future exposure scenarios are identified by playing in sediment on the beach for one or more days. The most significant risk is from (a)pyrene, which is a carcinogen. The risk estimates are based on the use of the equation described in Appendix C. Potential future exposure scenarios are identified by playing in sediment on the beach for one or more days. The risk estimates are based on the use of the equation described in Appendix C. Potential future exposure scenarios are identified by playing in sediment on the beach for one or more days.

The risk estimates are based on the use of the equation described in Appendix C. Potential future exposure scenarios are identified by playing in sediment on the beach for one or more days. First, each cPAH is multiplied by its relative potency factor (RPF). This factor scales the concentration relative to the potency of BaP. These modified concentrations are then summed as the BaP-Equivalent (BEQ) concentration. In 2010, EPA released draft report updating the RPFs of selected cPAHs in mixtures (8;14). This report considered more recent data and a wider range of cPAH compounds. Cancer risk is then estimated using the current oral cancer slope factor for BaP.

Using the 95% upper confidence limit of the average sediment concentration (159 mg/kg cPAH BEQ) the following estimated cancer risk estimates were calculated for touching or accidentally ingesting sediment from the shoreline at the site during daytime low tides:

- For every 1,000 local residents playing or recreating on the beach sediments at low tide during the day for a lifetime, there is an increased lifetime risk of developing *five additional cancer cases* (5.3×10^{-3});
- For every 1,000 people visiting the beach sediments during the three summer months for a lifetime, there is an increased lifetime risk of developing *two additional cancer cases* (2.2×10^{-3});
- For every 10,000 adults (ages 16 years and higher) trespassing onto the site and going onto beach sediments three days a week for a lifetime, there is an increased lifetime risk of developing *six additional cases of cancer cases* (5.5×10^{-4}).

Evaluation of Health Outcome Data

Evaluation of health outcome data (e.g., mortality and morbidity) in public health assessments are completed per ATSDR guidance (REF). The main requirements for evaluating this type of data include

- a completed pathway,
- high contaminant levels to result in measurable health effects,
- sufficient number people in the completed pathway for effects to be measured, and
- a health outcome database in which disease rates for the population of concern can be identified.

This site does not meet the requirements for including an evaluation of these data. Although a completed exposure pathway exists, the exposed population is not sufficiently defined or large enough.

Child Health Considerations

DOH recognizes that infants and children may be more vulnerable to exposures than adults in communities with contamination issues. This vulnerability is a result of the following factors. Children are more

- To bring food contaminated and ingesting in mouth to mouth exposures.
- To breathe higher levels of contaminants because they are smaller.
- To ingest soil because they crawl and play on the ground.
- To suffer more damage if exposure occurs during critical growth stages of the developing body.
- To be more susceptible to the effects of contaminants on their developing systems.
- This can result in more severe effects of exposure.

Health effects for children are more sensitive than for adults. The point of exposure for children is more critical than for adults.

children as the most sensitive population being exposed. In addition, an age-dependent adjustment factor is used to protect children 2 years old and younger and 3–6 year olds. Because of child-specific behaviors, estimated cancer risks for child residents and visitors six years old and younger have exposures that contribute to two-thirds of the lifetime cancer risk (up to 78 years).

Community Health Concerns

The purpose of this section is to document and respond to current, specific community health concerns. DOH conducted two site visits, one in July and one in August 2012. DOH is working with EPA to develop a community involvement and communication plan. EPA and DOH conducted community interviews on September 18, 2012. This meeting provided an opportunity to meet with residents to discuss concerns regarding the site. On October 10, 2012, DOH, met with the mayor of Bremerton, Public Works Director, community outreach, and two city council members. Staff discussed the Public Health Assessment process and ways to best communicate results of the report. The community has been invited to previous meetings regarding site activities during the EPA Brownfields Assessment. EPA and the Coast Guard posted signs informing residents of actions that occurred during the emergency

Community members, owners, and other members of the public brought forward the following health-related concerns and questions:

Cancer is a term used for diseases in which abnormal cells divide without control then invade other tissues. Cancer develops over many years and has many causes. Several factors, both inside and outside the body, contribute to cancer development. Often, doctors cannot explain why one person develops cancer and another does not. Likewise, we cannot determine if any cancers in the neighborhood were caused by a chemical released from the former MGP or other industrial operations. Each chemical is associated with a specific cancer. The individual chance that someone will develop cancer in response to a particular, single environmental exposure depends on 1) the potential of the chemical to cause cancer and 2) how long or how often that person was exposed. Each person is exposed differently.

Research from the National Cancer Institute's Surveillance, Epidemiology, and End Results (SEER) database shows that the incidence of colorectal cancer has declined by 50% since 1988, and that the overall mortality rate has declined by 65% since 1988. The decline in colorectal cancer incidence and mortality is largely due to the widespread use of colonoscopy, which has become the gold standard for colorectal cancer screening. Colonoscopy allows for the early detection and removal of precancerous polyps, which can prevent the development of colorectal cancer. Additionally, the use of colonoscopy has led to the early detection and treatment of colorectal cancer, which has improved survival rates. The decline in colorectal cancer incidence and mortality is a testament to the effectiveness of colonoscopy as a screening tool. However, it is important to note that the decline in colorectal cancer incidence and mortality is not universal. For example, the incidence of colorectal cancer has increased in young adults, and the mortality rate has increased in certain populations. Therefore, it is important to continue to research and improve colorectal cancer screening and treatment options.

No. Your department receives from the Bremer River. The City of Bremer River supplies from the Bremer River 100% of the power we use in the City. The City provided public lighting for the river since 1910.

We do not have information about whether Black people are more likely than white people to consume berries from SESCO property. In August, September, and October children and local residents collect and eat these berries. DOH recommends collecting and eating berries from a number of locations, not just one.

4. Can we eat the shellfish collected on the shoreline or fish caught near or at the site?

For many years, DOH has closed commercial shellfish harvest and recreational harvest on nearby publicly owned beaches. The closure is because of combined sewer overflow releases resulting in fecal contamination on beaches. We do not recommend eating shellfish harvested near the site. We do not know if chemicals from the site are in shellfish that live in the Narrows. However, chemicals have been found in the sediments these shellfish live in.

37

the site. With more soil, sediment, and tissue data a more accurate assessment of health threats will be possible.

9. Is it safe to swim in the water near the site?

We do not recommend swimming in the Washington Narrows for several reasons:

- Cold water can quickly incapacitate the best of swimmers.
- Tidal currents are so swift in the narrows that swimmers cannot break free of the current. Swimmers can be easily carried into open waters.
- We do not know the extent of contamination in the water or sediments of the Washington Narrows. Contaminants from in sediments can be released into the water column.

We do not know if swimming in the Narrows will result in chemical exposures. More data is needed to determine if a health threat exists from this type of exposure.

10. Are there signs posted about health risks at the site?

Kitsap Public Health District posted signs warning people on the beach about the contamination on the shore of the Washington Narrows.

Conclusions

In summary, we reviewed the available data on soil, groundwater, and sediment contamination from the site. DOH identified risks, such as potential exposure to heavy metals and organic chemicals, of concern. Several gaps were identified, including the need to further assess potential exposure pathways. Estimated exposure to PCBs in the sediments for 1) residents who live near the site and 2) visitors to the shore are very low. However, the potential for exposure to other contaminants is not known. Other exposure pathways, such as ingestion of sediment, are not known. More data is needed to assess the risks from the site.

Through

DOH reached six conclusions in this public health assessment:

Conclusion 1. Trespassing on the site could result in physical injury. This is an urgent public health hazard. Actions to remove or prevent these hazards have been recommended.

Conclusion 2. Residents, visitors, or trespassers touching or accidentally ingesting sediments for more than a year could harm the health of children or adults.

Conclusion 3. No one is drinking the contaminated groundwater located in the vicinity of the site. No harm is expected.

Conclusion 4. DOH cannot conclude if trespassers are touching contaminated soils at the site. The nature and extent of soil contamination are not known. Future land use may lead to contact with the soil. More soil sample data will be collected during EPA's upcoming RI.

Conclusion 5. DOH cannot conclude if people are being exposed to contaminants from eating fish or shellfish harvested at the site. Shellfish and fish tissue data are needed to assess any potential health threat.

Conclusion 6. DOH cannot conclude if people are being exposed to contaminants in blackberries collected at the site. Neither soil samples near blackberry bushes nor blackberry chemical data are available to assess this potential health threat.

Recommendations

To protect residents, visitors, and trespassers, DOH recommends that

- Physical hazards be removed.
- Site access be restricted.
- Ongoing source(s) of contaminants be identified and removed or mitigated to reduce the potential of exposure.
- People safeguard their health by not walking or playing on the shoreline near the site.
- Parents monitor their children's behavior while playing outdoors to prevent them from going onto the shoreline.

•

To protect shellfish sampling and plan.

Public Health Action Plan

DOH is beginning the following actions:

- EPA working for removal of FS and an action
- City of Bremerton calling at the end of Alvarado Ave each

•

•

•

- Owner removing the submarine ballast tanks in collaboration with EPA and Washington State Department of Natural Resources (DNR).
- EPA facilitating the maintenance of the capped area on the shoreline. The cap consists of an absorbent clay mat covered with large rocks. Maintenance should continue until the extent of contamination is known and a remedy is determined.
- EPA facilitating the removal of waste barrels found on Parcel A.
- EPA considering sampling plans to collect and analyzing fish, shellfish, and berries.

Report Preparation

This Public Health Assessment for initial release on the Bremerton Gasworks Superfund site in Kitsap County, Washington was prepared by the Washington Department of Health (DOH) under a cooperative agreement with the federal Agency for Toxic Substances and Disease Registry (ATSDR). It is in accordance with the approved agency methods, policies, and procedures existing at the date of publication. Editorial review was completed by the cooperative agreement partner (DOH). ATSDR has reviewed this document and concurs with its findings based on the information presented.

Agency

Appendix A–Glossary

Acute	Occurring over a short time [compare with chronic].
Agency for Toxic Substances and Disease Registry (ATSDR)	The principal federal public health agency involved with hazardous waste issues, responsible for preventing or reducing the harmful effects of exposure to hazardous substances on human health and quality of life. ATSDR is part of the U.S. Department of Health and Human Services.

Cancer Risk Evaluation Guide (CREG)	The concentration of a chemical in air, soil, or water that is expected to cause no more than one excess cancer in a million persons exposed over a lifetime. The CREG is a <i>comparison value</i> used to select contaminants of potential health concern and is based on the <i>cancer slope factor</i> (CSF).
Cancer Slope Factor (CSF)	A number assigned to a cancer causing chemical that is used to estimate its ability to cause cancer in humans.
Carcinogen	Any substance that causes cancer.
Chronic	Occurring over a long time (more than 1 year) [compare with acute].
Comparison Value (CV)	Calculated concentration of a substance in air, water, food, or soil that is unlikely to cause harmful (adverse) health effects in exposed people. The CV is used as a screening level during the public health assessment process. Substances found in amounts greater than their CVs might be selected for further evaluation in the public health assessment process.
Contaminant	A substance that is either present in an environment where it does not belong or is present at levels that might cause harmful (adverse) health effects.
Dermal Contact	Contact with (touching) the skin (see route of exposure).
Dose (for chemicals that are not radioactive)	The amount of a substance to which a person is exposed over some time period. Dose is a measurement of exposure. Dose is often expressed as milligram (amount) per kilogram (a measure of body weight) per day (a measure of time) when people eat or drink contaminated water, food, or soil. In general, the greater the dose, the greater the likelihood of an effect. An “exposure dose” is how much of a substance is encountered in the environment. An “absorbed dose” is the amount of a substance that actually got into the body through the eyes, skin, stomach, intestines, or lungs.
Environmental Media Evaluation Guide (EMEG)	A concentration in air, soil, or water below which adverse non-cancer health effects are not expected to occur. The EMEG is a comparison value used to select contaminants of potential health concern and is based on ATSDR’s minimal risk level (MRL).
Environmental Protection Agency (EPA)	United States Environmental Protection Agency.

Epidemiology	The study of the occurrence and causes of health effects in human populations. An epidemiological study often compares two groups of people who are alike except for one factor, such as exposure to a chemical or the presence of a health effect. The investigators try to determine if any factor (i.e., age, sex, occupation, economic status) is associated with the health effect.
Exposure	Contact with a substance by swallowing, breathing, or touching the skin or eyes. Exposure may be short-term [acute exposure], of intermediate duration, or long-term [chronic exposure].
Hazardous Substance	Any material that poses a threat to public health and/or the environment. Typical hazardous substances are materials that are toxic, corrosive, ignitable, explosive, or chemically reactive.
Ingestion	The act of swallowing something through eating, drinking, or mouthing objects. A hazardous substance can enter the body this way [see route of exposure].
Ingestion Rate (IR)	The amount of an environmental medium that could be ingested typically on a daily basis. Units for IR are usually liter/day for water, and mg/day for soil.
Inhalation	The act of breathing. A hazardous substance can enter the body this way [see route of exposure].
Inorganic	Compounds composed of mineral materials, including elemental salts and metals such as iron, aluminum, mercury, and zinc.
Lowest Observed Adverse Effect Level (LOAEL)	The lowest tested dose of a substance that has been reported to cause harmful (adverse) health effects in people or animals.
Maximum Contaminant Level (MCL)	A drinking water regulation established by the federal Safe Drinking Water Act. It is the maximum permissible concentration of a contaminant in water that is delivered to the free flowing outlet of the ultimate user of a public water system. MCLs are enforceable standards.
Media	Soil, water, air, plants, animals, or any other part of the environment that can contain contaminants.
Minimal Risk Level (MRL)	An ATSDR estimate of daily human exposure to a hazardous substance at or below which that substance is unlikely to pose a measurable risk of harmful (adverse), noncancerous effects. MRLs are calculated for a route of exposure (inhalation or oral) over a specified time period (acute, intermediate, or chronic). MRLs should not be used as predictors of harmful (adverse) health effects [see reference dose].

Model Toxics Control Act (MTCA)	The hazardous waste cleanup law for Washington State.
No Observed Adverse Effect Level (NOAEL)	The highest tested dose of a substance that has been reported to have no harmful (adverse) health effects on people or animals.
Oral Reference Dose (RfD)	An amount of chemical ingested into the body (i.e., dose) below which health effects are not expected. RfDs are published by EPA.
Organic	Compounds composed of carbon, including materials such as solvents, oils, and pesticides that are not easily dissolved in water.
Parts per billion (ppb)/Parts per million (ppm)	Units commonly used to express low concentrations of contaminants. For example, 1 ounce of trichloroethylene (TCE) in 1 million ounces of water is 1 ppm. 1 ounce of TCE in 1 billion ounces of water is 1 ppb. If one drop of TCE is mixed in a competition size swimming pool, the water will contain about 1 ppb of TCE.
Reference Dose Media Evaluation Guide (RMEG)	A concentration in air, soil, or water below which adverse non-cancer health effects are not expected to occur. The EMEG is a <i>comparison value</i> used to select contaminants of potential health concern and is based on EPA's oral reference dose (RfD).
Route of Exposure	The way people come into contact with a hazardous substance. Three routes of exposure are breathing [inhalation], eating or drinking [ingestion], or contact with the skin [dermal contact].

Appendix B—Data Summary

Appendix C—Assumptions, Calculations, and Estimates of Health Risks for Exposure to Chemicals in Sediments

This appendix of the public health assessment (for initial release) for the Bremerton Gasworks Superfund Site provides the methodology and assumptions (Table C1) used to calculate exposure doses for people coming into contact with the intertidal sediment at the site. A summary of exposure doses and health risk calculations are summarized for carcinogenic risks (Table C2).

The following scenarios for sediment exposures have been defined for this site:

- Future hypothetical resident (adult and child) playing at the beach daily
- Visitor (adult and child) during the summer months (or frequency of 1–2 times per year)
- Trespasser (adult) on the sediments 3 days a week.

Data Compilation

For chemicals with samples detected below the reporting limit but above the detection limit, the estimated value was used. Estimated values were designated by a “J” flag. Compounds that were not detected (designated with a U flag) were assumed to be present at the detection limit.

When possible, exposure point concentrations for sediments were derived by using a conservative estimate of the mean concentration. This conservative estimate is typically the upper limit of a 95% confidence interval (95% UCL) of the average concentration. The 95% UCL was calculated by ProUCL 4.1.00⁷ (15). The method of calculation was based on sample size, coefficient of variation, and the underlying distribution of the data. The sediment sampling source, location, number, and analytical data are listed in Appendix C and Table 2 in the main text.

At this time there is not sufficient soil data and no air or tissue data to estimate potential exposures. After these data gaps have been filled, these pathways can also be evaluated. All intertidal sediment samples from the Brownfield Assessment (2) and the Emergency interim action (1) were combined together to calculate the sediment exposure point concentration (C_s) for incidental ingestion and dermal contact at the beach. The data from the Ecology investigation in 1995 was not used as it is 15 years old.

It is important to point out that although residents have unrestricted access to the shoreline at this time, tidal fluctuations prevent access to sediments and decrease exposure frequency. Low tides permitting access to the shoreline during the day⁸ occur about 60% of the year (218 out of 365 days) mostly between March and September. DOH assumed that a resident nearby could be exposed a maximum number of 218 days and likely will be exposed much less frequently

⁷ <http://www.epa.gov/osp/hstl/tsc/software.htm>

⁸ Estimated number of days with low tides permitting access to the shoreline during the day were assumed to occur between 7am and 7pm, includes +4 tides or less relative to the average of the lowest tides recorded at this tide station (mean lower low water), and are based on NOAA 2011 data from the Tracyton, Dyes Inlet, tide station.

Sediment Exposure Dose Calculations

This section provides the assumptions and calculations used to estimate daily intakes for exposure to chemicals in sediments at the site. Exposure doses were calculated for incidental ingestion of sediment and dermal absorption of sediment adhered to skin. Inhalation of sediment particles was not considered as a route of exposure since inhalation of dust particles from wet sediments are not expected to occur. Volatile and semi-volatile organic chemicals in sediments have been identified as contaminants of concern.

The following equations were used to calculate exposures and risks:

Equation C1: Incidental Ingestion Route

Where,

The exposure factor (EF) will vary depending on the scenario (see scenario-specific calculations for EF in Table D1).

Equation C2: Skin Contact Route

Where,

Again, the exposure factor (EF) will vary depending on the scenario (see scenario-specific calculations for EF in Table D1).

Equation C3: Carcinogenic risks

If the carcinogenic risks are greater than an increased incidence of 1 cancer per 1 million people (1×10^{-6}) the exposure dose will be discussed further in the text.

Table C1. Exposure assumptions used in exposure evaluation of people in contact with sediments at the former MGP in Bremerton Washington

Parameter and Abbreviation		Value	Units	Source
Exposure dose for ingestion route	D(ing)	Calc.	mg/kg-day	$D(ing) = C \cdot IR \cdot CF \cdot EF / BW$
Exposure Dose for dermal route	D(der)	Calc.	mg/kg-day	$D(der) = (C \cdot AF \cdot ABS \cdot AD \cdot CF \cdot EF \cdot SA) / BW$
Concentration in sediment	Cs	Calc.	mg/kg	Mean chemical-specific concentration for sediment (95% UCL of the mean if adequate data available)
Conversion factor	CF	0.000001	kg/mg	Converts from kilograms soil to milligrams soil
Age-specific body weight	BW	9.2	kg	Body weight, Child 0.5 to < 1 year (EFH)
		11.4		Body weight, Child 1 to < 2 years (EFH)
		17.4		Body weight, Child 2 to < 6 years (EFH)
		31.8		Body weight, Child 6 to < 11 years (EFH)
		56.8		Body weight, Child 11 to < 16 years (EFH)
		71.6		Body weight, Child 16 to < 21 years (EFH)
		64.8		Body weight, Child 11 to < 21 years (EFH)
		80		Body weight, Adult 21 to < 65 years (EFH)
		76		Body weight, Adult 65+ years (EFH)
Exposure factor (EF=F*ED/AT)	EF	0.60	unitless	Local resident (daily exposure at low tide)
		0.25		Visitor
		0.43		Trespasser
Frequency	F	218	days/year	Resident: low tides occur during the day for 60% of the year (218/365 based on NOAA 2011 data)
		~90		Visitor: summertime months (3 months a year)
		156		Trespasser: onsite 3 days a week
Age-specific exposure duration	ED	0.5	year	Child 0.5 to < 1 yr
		1		Child 1 to < 2 yr
		4		Child 2 to < 6 yr
		5		Child 6 to < 11 yr
		5		Child 11 to < 16 yr
		5		Child 16 to < 21 yr
		10		Child 11 to < 21 yr
		44		Adult 21 to < 65 yr
		14		Adult 65+
Averaging time	AT	28470	day	Tribal averaging time, number of days in lifetime (78 years*365 days per year)
Age-Dependent Adjustment Factor	ADAF	10	unitless	Children < 2 years old
		3		Children 2 to < 16 years old
		1		Young adults and adults 16 years and older
Cancer Risk	CR	Calc.	(mg/kg-day) _i	Increased risk of getting cancer (CR=D*CSF*ED/78)
Cancer Slope Factor	CSF	7.3	unitless	For BaP used as a reference chemical for cPAHs, published by EPA
Ingestion parameters				
Incidental ingestion rate (central tendency)	IR	60	mg/day	Child 0.5 to < 1 year
		100		Child 1 to < 21 years

		50		Adult 21 years and older
Incidental ingestion rate (upper percentile) [results not presented]		100		Adult and Child 0.5 years to < 1 year (EFH Table 5-1)
		200		Child 1 to < 21 years old (EFH Table 5-1)
Dermal parameters				
Absorption duration	AD	1	day	Fraction of day sediment is in contact with the skin (worst-case) RAGS E
Skin-sediment adherence factor	AF	0.07	mg/cm ²	Amount of sediment that adheres to skin, child 1-6 years (RAGS E)
		0.2		Amount of sediment that adheres to skin, child and adult (7-31 years) (RAGS E)
Dermal absorption factor	ABS	PAH 0.13	unitless	Chemical-specific, fraction of chemical that absorbs through the skin in 24-hours (EPA RSL; EPA RAGS E)
Surface area	SA	2900	cm ²	Surface area exposed, child 1-6 years (RAGS E)
		5700		Surface area exposed, child and adult 7-31 years (RAGS E)

Sources: Guidance for developing soil screening levels for Superfund sites Abbreviations not defined in the table:

Results

Table C2. Estimated cancer risks resulting from central tendency exposures to carcinogenic polycyclic aromatic hydrocarbons (cPAH)^a in surface sediments near the former MGP from Bremerton, Kitsap County, Washington

Exposure Pathway	Age ^b	Concentration (mg/kg) ^c	Increased Cancer Risk		
			Incidental Ingestion	Dermal Contact	Total Cancer Risk
Resident (daily during low tides)	Young Child	159	1.7E-03	1.4E-03	3.1E-03
	Older Child		6.6E-03	7.5E-04	1.4E-03
	Young Adult to Adult		3.9E-04	3.7E-04	7.6E-04
	Lifetime		2.7E-03	2.5E-03	5.3E-03
Visitor (daily during summertime only)	Young Child	159	7.0E-04	5.9E-04	1.3E-03
	Older Child		2.7E-04	3.1E-04	5.8E-04
	Young Adult to Adult		1.6E-04	1.6E-04	3.2E-04
	Lifetime		1.1E-03	1.1E-03	2.2E-03
Trespasser (3 days per week)	Young Adult to Adult	159	2.8E-04	2.7E-04	5.5E-04

Notes:

a – Carcinogenic polycyclic aromatic hydrocarbons (cPAHs) classified by EPA as Group B2 Probable Human Carcinogens; calculations performed with EPA's slope factor 7.3 (mg/kg-day)⁻¹. Concentrations of each PAHs multiplied by carcinogenic potency factors relative to Benzo(a)pyrene (BaP) according to EPA 2010 and summed/expressed as BaP equivalents (BEQ).

b – Age groupings are young (03.5 to < 6 years), older (6 to < 16 years old) and young adult/adult (16 years and older)

c – Concentration represents 95% upper confidence limit of the mean sediment samples

Abbreviations: MGP – manufactured gas plant; mg/kg – milligrams chemical per kilogram sediment
